

**1 ABDOMINAL PAIN / PROBLEMS**

KEY QUESTIONS

1. Is s/he **completely awake** (alert)?
2. (**Female ≥ 12, male ≥ 50**) Did s/he **faint or pass out** (nearly faint)?
3. (**Female ≥ 45, male ≥ 35**) Is her/his pain **above the belly button** (navel)?

POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.

DLS \* Link to X-1

## KEY QUESTIONS

1. (Snakebite) Where is the snake now?
2. Does s/he have difficulty breathing or swallowing?
3. Is s/he completely awake (alert)?
4. When did this start (happen)?
5. Is her/his condition getting worse now (worsening)?
6. (Appropriate) Has s/he ever had an allergic reaction to this before?
  - a. (Yes) Does s/he have any special medications or injections to treat this kind of allergic reaction?
    - i. (Yes) Have they been used?

## POST-DISPATCH INSTRUCTIONS

- a. I'm sending the paramedics (ambulance) to help you now. Stay on the line and I'll tell you exactly what to do next.
- b. (Snakebite) Keep her/him from moving around. Keep the bitten area below heart-level if possible. Do not apply ice or a tourniquet. Do not give her/him any alcohol to drink.
- c. (Special medications/injections not yet used) Advise her/him to administer the medications now.

\* Stay on the line with caller if patient has a history of an allergic reaction to the same type of insect or substance or if her/his condition seems unstable or is worsening.

### 3 ANIMAL BITES / ATTACKS

#### KEY QUESTIONS

- ⊗ Unconscious or Arrest (per Case Entry) \_\_\_\_\_ 3-D-1
- 1. What kind of animal is it?  
Insect, spider, or snake \_\_\_\_\_ 2
- 2. Where is the animal now?
- 3. Is there any **SERIOUS bleeding**?
- ⊗ Unconscious or Arrest (per Case Entry) \_\_\_\_\_
- 4. Is s/he **completely awake** (alert)?
- 5. What **part** of the body was **bitten**?  
a. (Chest or Neck) Is s/he **breathing normally**?
- 6. What kind of **injuries** does s/he have?
- 7. **When** did this happen?

#### POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. **Avoid further contact** with the animal. ▽
- c. If it's **safe** to do so, **lock up** or **isolate** the animal. ▽

\* (Appropriate) Notify Animal Control.

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,507,481

AMPDS® v11.2, NAE-std, 041214

DANGEROUS Body Area	EXOTIC Animal	Rules
<ul style="list-style-type: none"> <li>• Armpit</li> <li>• Chest (abnormal breathing)</li> <li>• Groin</li> <li>• Head (not alert)</li> <li>• Neck</li> </ul>	Any animal that may be <b>poisonous, dangerous, or whose risk is unknown.</b>	1. Spider, insect, or snake bites should be <b>handled on Protocol 2.</b>
	<b>ATTACK</b>	<b>Axioms</b>
<b>POSSIBLY DANGEROUS Body Area</b> <ul style="list-style-type: none"> <li>• Abdomen</li> <li>• Amputation (excluding finger/toe)</li> <li>• Back</li> <li>• Chest (breathing normally)</li> <li>• Genitalia</li> <li>• Head (alert)</li> <li>• Leg, upper (femur)</li> <li>• Pelvis</li> </ul>	A <b>mauling</b> (or savaging) that produces <b>serious, multiple wounds or injuries</b> , as opposed to a single or limited number of bites or stings. Also, any event <b>in progress.</b>	1. Most mammal bites are <b>not prehospital emergencies.</b> However, <b>large animals</b> (lions, tigers, bears, crocodiles, sharks, horses, etc.), <b>EXOTIC animals</b> , and even some dogs (pit bulls, rottweilers) are capable of inflicting serious injuries. In these rare cases, a <b>maximal response</b> is indicated.
	<b>SERIOUS Hemorrhage</b>	2. On certain Protocols (3, 4, 7, 17, 27, etc.), an <b>arrest</b> may have been <b>caused</b> by extremely <b>SERIOUS hemorrhage.</b> In these cases, <b>controlling the bleeding before initiating CPR</b> may increase patient survival.
<b>NOT DANGEROUS Body Area</b> <ul style="list-style-type: none"> <li>• Ankle</li> <li>• Arm</li> <li>• Collar bone (clavicle)</li> <li>• Elbow</li> <li>• Finger</li> <li>• Foot</li> <li>• Hand</li> <li>• Hip</li> <li>• Knee</li> <li>• Leg, lower (tibia)</li> <li>• Shoulder</li> <li>• Toe</li> <li>• Wrist</li> </ul>	<b>NON-RECENT</b>	
	<b>SIX HOURS OR MORE</b> have passed since the incident or injury occurred.	
	<b>SUPERFICIAL Bites</b>	
	<b>Minor, usually shallow</b> (non-penetrating) wounds <b>without priority symptoms</b> ; even in <b>DANGEROUS or POSSIBLY DANGEROUS</b> body areas.	

# 4 ASSAULT / SEXUAL ASSAULT

## KEY QUESTIONS

- ⊕ Unconscious or Arrest (per Case Entry) ————— 4-D-1
- 1. Is the **assailant** (attacker) **still nearby**? \*
- 2. Were **weapons** involved or mentioned? \*
- 3. Is there any **SERIOUS** bleeding?
- ⊕ Unconscious or Arrest (per Case Entry) ————— \*
- 4. Is s/he **completely awake** (alert)?
- 5. Is s/he **breathing normally**?
- 6. (**Assault**) What **part** of the body was **injured**?  
(**Sexual assault**) Does s/he have any **other injuries**?
- 7. **When** did this **happen**?

## POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. (**Sexual assault**) **Do not change clothes, bathe, shower, or go to the bathroom.**

\* In volatile/criminal situations, refer to applicable law enforcement protocol. \*

Problem Suffixes	Problem Suffixes
<b>DANGEROUS Body Area</b>	<ul style="list-style-type: none"> <li>• Chest (abnormal breathing)</li> <li>• Head (not alert)</li> <li>• Neck</li> </ul>
<b>POSSIBLY DANGEROUS Body Area</b>	<ul style="list-style-type: none"> <li>• Abdomen</li> <li>• Amputation (excluding finger/toe)</li> <li>• Back</li> <li>• Chest (breathing normally)</li> <li>• Genitalia</li> <li>• Head (alert)</li> <li>• Leg, upper (femur)</li> <li>• Pelvis</li> </ul>
<b>NOT DANGEROUS Body Area</b>	<ul style="list-style-type: none"> <li>• Ankle</li> <li>• Arm</li> <li>• Collar bone (clavicle)</li> <li>• Elbow</li> <li>• Finger</li> <li>• Foot</li> <li>• Hand</li> <li>• Hip</li> <li>• Knee</li> <li>• Leg, lower (tibia)</li> <li>• Shoulder</li> <li>• Toe</li> <li>• Wrist</li> </ul>
<b>Problem Suffixes</b>	<p>The suffix codes help to delineate the type of problem for specific response and safety purposes:</p> <p>A = Assault S = Sexual Assault</p> <p><b>SERIOUS Hemorrhage</b> Uncontrolled bleeding (spurting or pouring) from any area, or any time a caller reports "serious" bleeding.</p> <p><b>NON-RECENT</b> Six hours or more have passed since the incident or injury occurred.</p> <p><b>Rules</b></p> <ol style="list-style-type: none"> <li>1. The <b>preservation of evidence</b> in sexual assault situations may be of much greater eventual importance to the patient than initial response and treatment of physical injuries.</li> <li>2. Sexual assault patients often require a very <b>high level of compassionate care</b>.</li> <li>3. The <b>head-tilt is the preferred method of airway control</b> in the dispatch environment. When a neck injury is likely, an attempt should first be made to open the airway without moving the neck. If this is unsuccessful, then advise to <b>gently tilt the head back</b>, a little at a time, until air goes in and the chest rises.</li> </ol>
	<p>be avoided in the presence of <b>visible fractured bone</b> or <b>foreign objects</b>.</p> <p><b>Axioms</b></p> <ol style="list-style-type: none"> <li>1. <b>Assault complaints are generally 3<sup>rd</sup> party</b> calls and are often received by police dispatch first.</li> <li>2. Injuries to <b>DANGEROUS</b> or <b>POSSIBLY DANGEROUS</b> body areas take response precedence in sexual assault situations.</li> <li>3. On certain Protocols (3, 4, 7, 17, 27, etc.), an <b>arrest</b> may have been <b>caused</b> by extremely <b>SERIOUS hemorrhage</b>. In these cases, <b>controlling the bleeding before initiating CPR</b> may increase patient survival.</li> <li>4. <b>When a problem is NON-RECENT</b>, the presence of current priority symptoms is the issue of most concern, not the location of the injuries per se.</li> <li>5. Medical Dispatch should always try to <b>obtain complete information</b>. Even if law enforcement personnel initially request "paramedics," response should be driven by specific priority problems (see SEND Protocol).</li> </ol> <p><b>SEND Protocol (Medical Miranda Card)</b></p> <p><b>Secondary Emergency Notification of Dispatch (SEND)</b> from police <b>should include</b> Chief Complaint, approximate age, level of consciousness, breathing status, presence of chest pain, and severity of bleeding (and position of head for lights and siren response).</p>

## 5 BACK PAIN (NON-TRAUMATIC OR NON-RECENT TRAUMA)

### KEY QUESTIONS

1. **When did this start** (happen)?
  - Recent fall (< 6hrs) \_\_\_\_\_ 17
  - Recent TRAUMA (< 6hrs) \_\_\_\_\_ 30
3. Does s/he have **difficulty breathing**?
  - Yes \_\_\_\_\_ 6
4. (**Female ≥ 45, male ≥ 35**) Does s/he have **chest pain also**?
  - Yes \_\_\_\_\_ 10
5. Is s/he **completely awake** (alert)?
6. (≥ 50) Did s/he **faint or pass out** (nearly faint)?

### POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.

DLS \* Link to ☎ X-1

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

### NON-TRAUMATIC

**Not primarily caused** by an external physical injury.

### NON-RECENT

**Six hours or more** have passed since the incident or injury occurred.

### TRAUMA

A **physical injury or wound** caused by an external force through accident or violence.

### First Law of Chest Pain

"Hurts to breathe" is not considered difficulty or abnormal breathing.

### Rules

1. Back Pain should only be selected as the Chief Complaint when it is initially clear on Case Entry that the cause is **NON-RECENT traumatic or NON-TRAUMATIC back pain**. If unclear, **select Protocol 30**.
2. **NON-TRAUMATIC** back pain associated with fainting (or near fainting) in patients ≥ 50 is considered to be a **dissecting aortic aneurysm until proven otherwise**.

### Axioms

1. Severity of **pain is not related to the seriousness** of the problem.
2. When back pain is caused by a **NON-RECENT** injury, **spinal cord injury is very unlikely**.

### NON-TRAUMATIC Causes of Back Pain

- Dissecting aortic aneurysm
- Kidney stone
- Low back syndrome
- Pyelonephritis (kidney infection)
- Vertebral disc disease

### NON-RECENT Traumatic Causes of Back Pain

- Bruised spine
- Fractured ribs
- Fractured spine
- Injured nerve
- Sprained back

### Symptoms of Possible Spinal Cord Injury

- Abnormal breathing
- No pain or movement below injury
- Tingling sensation or numbness in extremities

KEY QUESTIONS

1. Is s/he able to **talk** to you (cry) at all?
  - a. (Yes) Does s/he have **difficulty** speaking **between** breaths?
  - b. (No) Did s/he **choke** on anything first?  
Yes \_\_\_\_\_
2. Is s/he **completely awake** (alert)?
3. Is s/he **changing color**?
4. Is s/he **clammy** (cold sweats)?
5. Does s/he have a **history of heart problems**?
6. Does s/he have **asthma**?
7. (**Tracheostomy blockage**) Does s/he have any **special equipment or instructions** to treat this?
  - a. (Yes) Have they been **used**?

POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. (**Patient medication requested**) Remind her/him to do what her/his **doctor has instructed** for these situations.
- c. (**Special equipment/instructions not yet used**) Advise her/him to **use that treatment now**.

<b>B</b>	1	Unknown status (3 <sup>rd</sup> party caller)		7-B-1		
<b>A</b>	1	Burns < 18% body area		7-A-1		
	2	Fire alarm (unknown situation)		7-A-2	<input checked="" type="radio"/>	
	3	Sunburn or MINOR burns (≤ hand size)		7-A-3		

NOT LICENSED FOR USE IN ANY ON-LINE CALLTAKING POSITION

For use under MPDS® license agreement only. © 2004 Priority Dispatch Corp. All rights reserved.

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

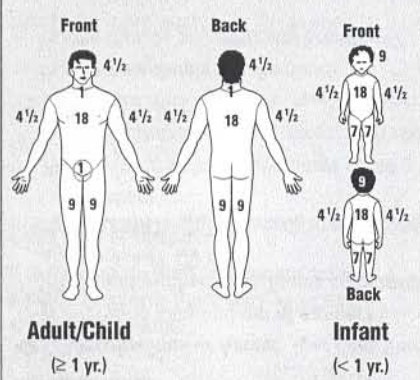

**SEVERE RESPIRATORY DISTRESS**

Complaints may include but are not limited to:

- Changing color
- Difficulty speaking between breaths (unable to complete a full sentence without breathing; can only speak a few words at a time)

**RULE OF NINES**

Useful in estimating the percentage of body surface burned. In the adult, the **areas of the body can be approximately divided into portions that are multiples of 9%**. In the infant, relatively more area is taken up by the head and less by the legs.

**MINOR Burns**

A burn (usually ≤ hand size) that is clearly trivial, non-threatening, and is not a cause of immediate concern.

**Problem Suffixes**

The suffix codes help to delineate the type of problem for specific response and safety purposes:

- E = Explosion
- F = Fire present

**Rules**

1. **INEFFECTIVE BREATHING** discovered during Key Questioning should be coded as **SEVERE RESPIRATORY DISTRESS (DELTA)**.
2. Use the **RULE OF NINES** to determine the approximate size of the burn for response assignment purposes.
3. Relay to responders a **simple description of burned areas**, not the **RULE OF NINES** percentage (%). A description is the more useful form of information.
4. All electrical burns are considered to be **worse than they look externally**.
5. **Consider the type of location**, along with the structure type, when processing explosion incidents. The type of location

(residences/offices of high-profile persons, government structures, industrial/research facilities) **may indicate a deliberate terrorist act** has occurred.

**Axioms**

1. **Pediatric** patients or patients with **large burns** may develop hypothermia when **exposed to prolonged cooling with water**.
2. **Use caution when cooling burns** in cold climates or in areas with prolonged response times.
3. Most scene care for burn patients is **supportive and compassionate**.
4. Explosions may occur as the **result of a bomb** or because of a **non-intentional event** such as a gas leak with an ignition source.

**First Law of Burns**

If someone was burned, something might be burning.

**Burn Categories**

- **Full thickness** (3<sup>rd</sup> degree): all skin layers
- **Partial thickness** (2<sup>nd</sup> degree): blistering
- **Superficial** (1<sup>st</sup> degree): reddening, sunburn

KEY QUESTIONS

- ⊗ Unconscious or Arrest (per Case Entry) \_\_\_\_\_
- 1. Is everyone **safe** and **out of danger**?
- 2. What kind of **chemicals/fumes** or **hazardous materials** are involved? ☠️
- a. (HAZMAT) Do you know the warning **placard numbers** (chemical ID)?
- 3. **Where** are the **chemicals/fumes** coming from?
- 4. Is s/he **contaminated** (skin contact) with **chemicals**?
- ⊗ Unconscious or Arrest (per Case Entry) \_\_\_\_\_
- 5. Is s/he **completely awake** (alert)?
- 6. Is s/he having any **difficulty breathing**?

POST-DISPATCH INSTRUCTIONS

\* Advise caller and responders of any potential hazards. ▾

DLS \* Link to ☎️ X-1 unless: ↶

- Danger or Contamination \_\_\_\_\_ ▾ X-7
- Unconscious or Arrest \_\_\_\_\_ ⊗ ABC-1
- INEFFECTIVE BREATHING and Not alert \_\_\_\_\_ ☞ ABC-1

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

**SEVERE RESPIRATORY DISTRESS**

Complaints may include but are not limited to:

- Changing color
- Difficulty speaking between breaths (unable to complete a full sentence without breathing; can only speak a few words at a time)

**Rules**

1. All hazardous exposures and inhalations are considered **high-level emergencies until proven otherwise**.
2. The caller should be advised **not to enter or re-enter a hazardous or dangerous environment**.

**Essential Information for Reporting a HAZMAT ☠️ Emergency**

1. Name and telephone number of caller.
2. Location, source, and nature (e.g., leak, explosion, derailment) of release.
3. Number of dead or injured.
4. Name of acutely toxic chemical released.
5. Description of the container.
6. Amount of chemical released so far and duration of release.
7. Type of release (e.g., instantaneous, continuous, intermittent).
8. Time of release.
9. Total possible amount of chemical that may be released.
10. Present state of the chemical (gas, liquid, etc.).
11. Whether significant amounts of the chemical appear to be entering the atmosphere.
12. Direction of vapor clouds or fumes.
13. Weather conditions.
14. Local terrain conditions.

**HAZMAT ☠️**

An incident involving a gas, liquid, or other material that, in any quantity, **poses a threat to life, health, or property**.

**Axioms**

1. **Patients who have inhaled** smoke, carbon monoxide, or other chemicals may be **found in any stage of intoxication**. Carbon monoxide binds very tightly to hemoglobin and can lead to an **urgent situation**.
2. **Unconsciousness** in a patient who has inhaled carbon monoxide is a **bad sign**. Hyperbaric oxygen treatment may be necessary to prevent death or brain damage.

**First Law of Responders**

Don't take more victims to the scene.

**Second Law of Responders**

Don't get it on you or even touch it.

**Third Law of Responders**

If there is more than one unconscious patient on-scene, there may be scene safety implications.

KEY QUESTIONS

- Did you see what **happened**?
  - (Yes) Did s/he **choke** on anything **first**?
- (Appropriate ≥ 8) Is there a **defibrillator** (AED) available?
- (Suspected death) Tell me please, **why** does it look like s/he's **dead**?
  - (OBVIOUS DEATH) Do you think s/he is **beyond** any **help** (resuscitation/CPR)?
  - (EXPECTED DEATH) Are you **certain** we should **not** try to **resuscitate** her/him?

POST-DISPATCH INSTRUCTIONS

- (Suspected Workable Arrest) I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- (OBVIOUS or EXPECTED DEATH) I'm sending someone to **assist** you. Is there **anything else** we can do?

\* (OBVIOUS or EXPECTED DEATH) Notify proper authorities.

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

**OBVIOUS DEATH**

Local Medical Control must define and authorize (X) any of the patient conditions below before this determinant can be used. Situations should be unquestionable and may include:

- a - Cold and stiff in a warm environment
- b - Decapitation
- c - Decomposition
- d - Incineration
- e - **NON-RECENT** death
- f - Severe injuries obviously incompatible with life
- g - Submersion (> 6hrs)
- h - \_\_\_\_\_
- i - \_\_\_\_\_

Approval signature of local Medical Control \_\_\_\_\_ Date approved \_\_\_\_\_

**EXPECTED DEATH**

Local Medical Control must define and authorize (X) any of the patient conditions below before this determinant can be used. Situations should be unquestionable and may include:

- x - Terminal illness
- y - **DNR (Do Not Resuscitate) Order**
- z - \_\_\_\_\_

Approval signature of local Medical Control \_\_\_\_\_ Date approved \_\_\_\_\_

**NON-RECENT**

Six hours or more have passed since the incident or injury occurred.

**INEFFECTIVE BREATHING**

The following, when **volunteered** at any point during Case Entry (code as **ECHO** on 2, 6, 9, 11, 15, 31):

- "Barely breathing"
- "Can't breathe at all"
- "Fighting for air"
- "Gasping for air" (**AGONAL BREATHING**)
- "Making funny noises" (**AGONAL BREATHING**)
- "Not breathing"
- "Turning blue or purple"

**? Determining AGONAL BREATHING**

When the patient is **unconscious** or **not alert** and is **breathing abnormally** or **irregularly**, the EMD should **tell the caller** to state when the patient **takes each breath**. If the **time between breaths is 10 seconds or more**, this should be immediately considered **INEFFECTIVE BREATHING** that is likely a fading, **AGONAL** (dying) respiratory pattern. Check a maximum of **five breaths** (four intervals tested).

(Read verbatim) Okay, I want you to tell me every time s/he takes a breath, starting now.

- **AGONAL = ≥ 10 sec. interval**

**Rules**

- Often, when faced with a dying **DNR** patient, **callers just want reassurance that they are doing the right thing**. However, if the caller believes the **DNR** should be ignored or is uncertain if the

DNR is valid or in place, an appropriate response and resuscitation attempt should be made.

- A healthy child (or young adult) found in cardiac arrest is considered to have a **foreign body airway obstruction until proven otherwise**.
- An unconscious person in whom breathing cannot be verified by a 2<sup>nd</sup> party caller (with the patient) is considered to be in **cardiac arrest until proven otherwise**.
- When the initial **Chief Complaint** appears to be seizure, go to Protocol 12 regardless of consciousness and breathing status.

**Axioms**

- "Funny noises" reported by the caller generally means the patient is unconscious with an uncontrolled airway and often represents **AGONAL** (dying) respirations at the **beginning of a cardiac arrest**.
- AGONAL** respirations can be confused with "still breathing" before they fade away during an arrest.
- Automated external defibrillators (AED) might also be called "**shock boxes**." Other local names may be used.

**DNR (Do Not Resuscitate) Order**

A physician's order directing medical personnel to not attempt to revive a patient using CPR or other extraordinary means.

KEY QUESTIONS

1. Is s/he **completely awake** (alert)?
2. Is s/he **breathing normally**?
3. Is s/he **changing color**?
4. Is s/he **clammy** (cold sweats)?
5. Does s/he have a **history of heart problems**?
6. Did s/he take any **drugs or medications** in the past **12 hours**?

Cocaine (or derivative)  
Medications

POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. (**Patient medication requested**) Remind her/him to do what her/his **doctor has instructed** for these situations.
- c. ( $\geq 8$ ) If there is a **defibrillator** (AED) available, **send** someone to get it **now** in case we need it later.

\* **Stay on the line with caller** if her/his condition seems **unstable** or is **worsening**.

DLS \* Link to X-1 unless:

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

**SEVERE RESPIRATORY DISTRESS**

Complaints may include but are not limited to:

- Changing color
- Difficulty speaking between breaths (unable to complete a full sentence without breathing; can only speak a few words at a time)

**Rules**

1. **INEFFECTIVE BREATHING** discovered during Key Questioning should be coded as **SEVERE RESPIRATORY DISTRESS (DELTA)**.
2. A patient having a **heart attack may worsen at any time**. Always advise to call back if condition worsens.
3. A patient  $\geq 35$  with chest pain is considered a **heart attack patient until proven otherwise**.
4. If the **caller asks** whether the patient should be given their medication now, the EMD should **only give instructions included in the protocol**.
5. Chest pain **due to trauma** (current or non-recent) should be **handled on Protocol 30**.

**First Law of Chest Pain**

"Hurts to breathe" is not considered difficulty or abnormal breathing.

**Second Law of Chest Pain**

A little chest pain may be as bad as a lot

**Axioms**

1. True heart attacks are **uncommon in females  $< 45$  and males  $< 35$** .
2. Medical dispatch may consider heart attack (and an ALS CHARLIE response) in certain patients  $< 35$  when the **symptoms listed in Heart Attack Symptoms strongly suggest** the possibility.
3. Automated external defibrillators (AED) might also be called **"shock boxes."** Other local names may be used.

**Heart Attack Symptoms**

EMDs may initially receive non-specific complaints in heart attack cases. Due to patient denial or caller confusion, the following **symptoms may not be recognized as a heart attack:**

- Aching pain
- Chest pain (now gone)
- Constricting band
- Crushing discomfort
- Heaviness
- Numbness
- Pressure
- Tightness

While these symptoms are most common in the **chest**, they may also (or only) be present in the **arm(s), jaw, neck, or upper back**. These symptoms should be **handled**

**Thrombolytic Therapy**

The use of drugs such as tissue Plasminogen Activator (t-PA) and Streptokinase to break down the blood clots that may precipitate a heart attack. This therapy has resulted in new hope for people who suffer a heart attack. EMD is a vital first link in the "Chain of Survival" for these patients.

**Critical Problems**

- Dissecting thoracic aortic aneurysm
- Heart attack (myocardial infarction)

**Potentially Critical Problems**

- Angina (myocardial insufficiency)
- Pericarditis
- Pneumothorax
- Pulmonary embolus (blood clot in lung)

**Non-Critical Problems**

- Esophagitis
- Hiatal hernia ( $< 35$ )
- Pleurisy
- Pneumonia (except very young or elderly)
- Viral illnesses

KEY QUESTIONS

- ☛ Choking verified or Unconscious (per Case Entry) —
- 1. Is s/he **completely awake** (alert)?
- 2. Is s/he **breathing normally**?
- 3. (**Alert & breathing normally**) Is s/he able to **talk** (or **cry**)?
- 4. **What** did s/he **choke** on?

POST-DISPATCH INSTRUCTIONS

- a. (I'm sending the **paramedics** (ambulance) to help you now.) **Stay on the line** and I'll tell you **exactly** what to do next.
- b. **Don't slap** her/him on the back.

NOT LICENSED FOR USE IN ANY ON-LINE CALLTAKING POSITION

PARTIAL Obstruction	Axioms	Choking
<p>Complaints may include but are not limited to:</p> <ul style="list-style-type: none"> <li>• Forceful coughs</li> <li>• Wheezing sounds between coughs</li> <li>• Abnormal breathing</li> <li>• Difficulty speaking normally</li> </ul>	<ol style="list-style-type: none"> <li>1. <b>PARTIAL obstruction can be made more life-threatening</b> by attempted intervention in the breathing patient. The best approach for <b>PARTIAL</b> airway obstruction is to let the affected person try to clear their airway on their own.</li> <li>2. As true choking rarely occurs with liquids, gagging is a better term for the choking-like phenomenon that occurs with baby formula and other liquids. <b>Gagging is rarely a prehospital emergency.</b></li> </ol>	<p>Choking occurs when the airway is <b>partially</b> or <b>totally blocked</b> by an object. While most choking involves food (at restaurants, barbecues, and in the home), small children can choke on toys or other objects they put in their mouths, and many people choke on chewing gum.</p>
<p><b>Rules</b></p> <ol style="list-style-type: none"> <li>1. A healthy child (or young adult) found in cardiac arrest is considered to have a <b>foreign body airway obstruction until proven otherwise.</b></li> <li>2. <b>Only if the victim of a PARTIAL obstruction begins to faint</b> (pass out) should the EMD instruct the caller to try an obstructed airway maneuver, since the patient can no longer make efforts to clear his own airway.</li> <li>3. Before ALPHA-response selection the caller needs to <b>verify that the patient is not choking now</b> (can talk or cry, is alert and breathing normally).</li> <li>4. <b>Back slaps are not recommended</b> in the DLS environment due to the increased risk of injury from overly forceful or misplaced blows from an untrained caller.</li> </ol>		<p><b>Repetitive Persistence Examples</b></p> <p><b>Always combine a command</b>—"calm down"—<b>with a reason</b>—"so we can help." Pick an appropriate phrase and <b>repeat it verbatim.</b></p> <ul style="list-style-type: none"> <li>• "Ma'am, you're going to have to <b>calm down</b> in order to <b>help your baby.</b>"</li> <li>• "Sir, please <b>calm down</b> and <b>listen</b> to me carefully so that we're <b>sure to do it right.</b>"</li> <li>• "Your son needs you to <b>calm down</b> so that you can <b>help him.</b>"</li> </ul>
		<p><b>Reassurance Examples</b></p> <ul style="list-style-type: none"> <li>• "It's okay, we can do this <b>together.</b>"</li> <li>• "You're doing <b>great.</b>"</li> <li>• "I am here <b>with you.</b>"</li> <li>• "That's very <b>good.</b>"</li> </ul>

KEY QUESTIONS

1. Has s/he had **more than one** seizure in a row?
2. (**Female 12-50**) Is she **pregnant**?
3. Is s/he **diabetic**?
4. Does s/he have a **history of heart problems**?
5. Is s/he an **epileptic** or ever had a **seizure before**?
6. Has the jerking (twitching) **stopped** yet?  
(You go check and tell me what you find.)
  - a. (**Yes**) Is s/he **breathing now**?  
(You go check and tell me what you find.)
  - i. (**Yes**) Is s/he **breathing regularly**? **?**

POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. If s/he is still **seizing** (or if s/he **starts** to seize again):
  1. **Don't do CPR.**
  2. **Don't hold her/him down** or **force** anything **into** her/his mouth.
  3. **Move dangerous objects** away from her/him.
- c. When s/he **stops** seizing, (lay her/him down and) make sure s/he is **breathing**.
- d. **Turn her/him gently on her/his side** when the seizure stops.
- e. When s/he **wakes up**, reassure her/him and **tell her/him not** to get up or walk around.
- f. (**Not seizing**) If s/he **starts** to seize **again**, call me back **immediately**.

\* Stay on the line with caller until the patient starts to wake up.

DLS \* Link to X-1 unless:

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

**CONTINUOUS Seizure**

A seizure **still in progress at the end of the interrogation** and after a physical verification by the caller (EMD must stay on the line to check).

**MULTIPLE Seizures**

The occurrence of more than one seizure in a patient who **remains unconscious or not alert between episodes**.

**➔ Concurrent Problem Suffix**

The suffix code for epilepsy helps to delineate the presence of this condition regardless of the patient's acuity and may be used to track patient outcomes:

**E** = Epileptic or Previous history of seizures

**Recurrent Seizures**

**Epileptics may have more than one seizure in a day**. These are considered recurrent seizures if the patient is able to regain consciousness between episodes.

**Seizure**

An abnormal firing of brain cells, usually resulting in jerking movements. Also known as **convulsions**, epilepsy, or fits.

**Febrile Seizure**

Febrile seizures occur in 3 to 5 percent of all children between 6 months and 5 years of age as the result of fever. They are **not prehospital emergencies**, but must be always

evaluated by a physician to rule out rare but serious brain infections. **The risk of death from a febrile seizure itself is virtually zero.**

**Rules**

1. A seizure in a person  $\geq$  35 is considered a **cardiac arrest until regular breathing is physically verified** by the caller.
2. **Check ABCs very carefully** before initiating CPR after a seizure.
3. When the initial **Chief Complaint** appears to be **seizure**, go to Protocol 12 regardless of consciousness and breathing status.
4. **Do not attempt to reduce fever** in febrile seizure patients.

**Axioms**

1. Seizure-like activity can be an **initial symptom of cardiac arrest**.
2. All actively seizing patients **appear to have abnormal or absent breathing**.
3. A seizure patient with an **unknown history of seizures** has most likely had seizures before.
4. Tonic-clonic (grand mal) seizures generally **last about 60 seconds**.
5. **Reducing fever** in a child after a febrile seizure is of **little value** as the precipitating factor is believed to be the rapid rise of temperature. The fever itself is of no harm and may even help the body battle the infecting microbes

**Types of Seizures**

- **Generalized**
  - Absence (petit mal)
  - Atonic (drop attack)
  - Myoclonic
  - Tonic-clonic (grand mal)
- **Simple partial**
  - Focal/Local
- **Complex partial**
  - Temporal lobe/Psychomotor

**Causes of Seizures**

- **Cardiac arrest** (anoxia-lack of oxygen)
- Diabetes (low and high blood sugar)
- Drug (cocaine, amphetamine)
- Eclampsia (due to pregnancy)
- Epilepsy (unknown cause)
- Fever (in children)
- Hypoxia (inadequate oxygen)
- Meningitis (infection around the brain)
- Trauma
- Tumor

**Problems Associated with Seizures**

- After-seizure confusion (post-ictal)
- Airway control
- Aspirated secretions
- **CONTINUOUS or MULTIPLE** seizures
- Inappropriate CPR
- Tongue biting

# 13 DIABETIC PROBLEMS

## KEY QUESTIONS

☞ Unconscious (per Case Entry)

1. Is s/he **completely awake** (alert)?
2. Is s/he **behaving normally now**?
3. Is s/he **breathing normally**?

13-D-1

## POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. **(Patient medication requested)** Remind her/him to do what her/his **doctor has instructed** for these situations.
- c. **(Combative and ≥ 8)** If it's **safe** to do so, **observe** her/him continuously and **protect** her/him from her/himself.

➔ Concurrent Problem Suffix	Axioms	Hypoglycemia/Insulin Shock (rapid onset)
The suffix code is added whenever the patient appears to be combative or aggressive, and allows a different response and awareness of the situation: <b>C</b> = Combative or Aggressive	<ol style="list-style-type: none"> <li>1. Diabetes is a "diagnosis" that <b>EMDs may accept at face value</b> because of its high degree of accuracy.</li> <li>2. A <b>significant potential for error</b> is to confuse alcohol or drug intoxication with low blood sugar from too much insulin (insulin shock).</li> <li>3. An <b>early sign of low blood sugar is abnormal behavior</b>, which may include agitation, aggressiveness, confusion, and/or combativeness.</li> </ol>	Too much insulin has depleted the body's available blood sugar. Since the brain's most usable fuel is sugar, it is the first organ at risk. This is <b>more serious if the patient is not alert, and is commonly confused with alcohol intoxication.</b>
<b>Coma</b> A state of unconsciousness from which the <b>patient cannot be aroused.</b>		<b>Diabetic Ketoacidosis (gradual onset)</b> Pre-coma state resulting from insufficient insulin. Unable to use sugar as fuel, the body burns its own tissue (fat, muscle). The ketoacids (acetones) produced are "toxic" to the patient and cause a slowly increasing illness state. This is <b>not considered a prehospital medical emergency</b> if the patient is alert, but requires medical evaluation and treatment.
<b>Rules</b> <ol style="list-style-type: none"> <li>1. Determining the <b>level of consciousness is the key</b> to correctly assigning the prehospital response.</li> <li>2. EMDs should <b>not advise administration of oral sugar to symptomatic diabetics</b>. There is no clinical evidence of improved outcome by such EMD intervention, while the potential for airway obstruction in the not alert patient is high.</li> <li>3. The airway of an unconscious patient <b>must be constantly maintained.</b></li> <li>4. If the <b>caller asks</b> whether the patient should be given their medication now, the EMD should <b>only give instructions included in the protocol.</b></li> </ol>		<b>Diabetic Coma (later onset)</b> Unconsciousness or decreased level of consciousness occurring later in untreated diabetic ketoacidosis. Without an accurate history, this problem may be difficult to tell from insulin shock. <b>Airway control is the first priority in Post-Dispatch Instructions if the patient is unconscious.</b>

# 14 DROWNING (NEAR) / DIVING / SCUBA ACCIDENT

## KEY QUESTIONS

1. **Where** is s/he now?
2. Does s/he have any **injuries**?
3. Is s/he **completely awake** (alert)?
4. Is s/he **breathing normally**?

Unconscious (per Case Entry) \_\_\_\_\_ 14-D-1

## POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. **Do not go in the water** unless it's **safe** to do so.

AMPDS® v11.2, NAE-std, 041214

### DIVING

To **jump** or **plunge** into water from a height.

### SCUBA

A commonly used acronym for **Self-Contained Underwater Breathing Apparatus**, used here to define problems occurring while using this device underwater.

### Prolonged Submersion Case Example

In 1986, a 2½-year-old girl was **submerged in a cold-water river for over 63 minutes and survived** without serious brain damage after an extensive resuscitation that included internal warming from a heart/lung bypass machine at a children's trauma center. No one knows how long a patient can be submerged and still survive.

### Rules

1. **The current location of a drowning patient** (in water, underwater, out of water) **should be determined on Case Entry** during "What's the problem, tell me exactly what happened?" This ensures proper use of **ECHO** coding for patients underwater or not breathing.
2. A submerged patient, regardless of time underwater (≤ 6 hours), is considered **resuscitatable by definition until proven otherwise**, especially in a cold-water situation.
3. Each year potential rescuers drown themselves attempting to save drowning people. The caller should be advised to **attempt a rescue only if it is safe to do so**.
4. In diving accidents where there is any suspicion of neck injury, **tilting the head or moving the patient should be avoided** if at all possible.
5. The **head-tilt is the preferred method of airway control** in the dispatch environment. When a neck injury is likely, an attempt should first be made to open the airway without moving the neck. If this is unsuccessful, then advise to **gently tilt the head back**, a little at a time, until air goes in and the chest rises.

6. The airway of an unconscious patient **must be constantly maintained**.

### Axioms

1. Victims of cold-water drowning **can remain underwater for long periods of time before death or brain damage occurs**. An automatic body reflex called the "diving reflex" is triggered in cold water. Inhaled cold water may also lower blood and body temperature. The heart usually remains beating for a few minutes after submersion.
2. The "**diving reflex**" is **more pronounced in children under four years of age**, possibly because of a similar reflex experienced during childbirth enabling the fetus to survive on limited oxygen.

KEY QUESTIONS

- ⊗ Unconscious (per Case Entry) \_\_\_\_\_
- 1. Where is s/he now?
- 2. Is s/he disconnected from the power?
- 3. Has the power been turned off?
- 4. (Suspected) Is anything still on fire?
- 5. Did s/he fall off something when this happened?
  - a. (Yes) How far did s/he fall (≥ 6ft/2m)?
- ⊗ Unconscious or Arrest (per Case Entry) \_\_\_\_\_
- 6. Is s/he completely awake (alert)?
- 7. Is s/he breathing normally?

POST-DISPATCH INSTRUCTIONS

- a. I'm sending the paramedics (ambulance) to help you now. Stay on the line and I'll tell you exactly what to do next.
- b. Beware of electrical risks and electrified water.
- c. If it's safe to do so, turn off the power.
- d. (≥ 8) If there is a defibrillator (AED) available, send someone to get it now in case we need it later.

- \* Stay on the line with caller until breathing can be safely verified.
- \* Advise caller and responders of any potential hazards.

LONG FALL	Rules	Axioms
<p>The patient has fallen from a distance of <b>six feet/two meters or higher</b> (i.e., lowest part of the body was above 6ft/2m).</p>	<ol style="list-style-type: none"> <li>All electrocution and lightning strike patients are <b>assumed to be in cardiac arrest until regular breathing is physically verified</b>. Stay on the line with the caller until breathing can be safely verified.</li> <li>If cardiac arrest in an unconscious lightning strike patient is confirmed, the <b>CPR Ventilations 1<sup>st</sup> pathway should be selected</b> for care.</li> <li>Advise the caller to <b>beware of electrical risks and electrified water</b>. Do not advise any treatment unless it is safe to do so.</li> <li>The airway of an unconscious patient <b>must be constantly maintained</b>.</li> <li>All electrical burns are considered to be <b>worse than they look externally</b>.</li> </ol>	<ol style="list-style-type: none"> <li>Hidden exit wounds and internal injuries may <b>complicate the patient's status</b>.</li> <li>Electrocutions and lightning strikes occurring above the ground may result in significant falls, causing <b>injuries that may be more serious than those incurred from the electrocution or lightning</b>. Answering all Key Questions should ensure this is not overlooked.</li> <li>Each year many potential rescuers are injured attempting to help. The caller should be advised to <b>attempt a rescue only if it is safe to do so</b>.</li> <li><b>A bystander can be electrocuted just getting close to the patient</b>, without even touching her/him, when high voltage is involved or the ground is wet.</li> <li>Lightning accounts for about <b>200 deaths</b> in the U.S. per year and <b>strikes the ground somewhere</b> in the world <b>100 times a second</b>.</li> </ol>
<p><b>➔ Problem Suffixes</b></p> <p>The suffix codes help to delineate the type of problem for specific response and safety purposes:</p> <p>E = Electrocution L = Lightning</p>	<p><b>First Law of Responders</b></p> <p>Don't take more victims to the scene.</p> <p><b>Second Law of Responders</b></p> <p>Don't get it on you or even touch it.</p> <p><b>Third Law of Responders</b></p> <p>If there is more than one unconscious patient on-scene, there may be scene safety implications.</p>	
<p><b>Lightning Strike Arrest Theory</b></p> <p>The current theory connecting lightning and cardiac injury is that lightning acts as a cosmic countershock, sending the heart into asystole (the absence of heart contractions). The heart will often resume its rhythm due to the heart's property of automaticity, but <b>the accompanying respiratory arrest is more lasting, leading to a secondary cardiac arrest</b> and arrhythmias due to hypoxia (lack of oxygen).</p> <p>(Source: "Emergent Care of Lightning and Electrical Injuries," by Mary Ann Cooper, M.D. In <i>FACEP Seminars in Neurology</i>, Vol. 15, Num. 3, September 1995.)</p>		

# 16 EYE PROBLEMS / INJURIES

## KEY QUESTIONS

1. Is s/he **completely awake** (alert)?
2. **How** did this happen?
  - Chemical
  - Contact lens
  - Direct blow
  - Flying object
  - MEDICAL eye problem
  - Penetrating object
  - Small foreign object
  - Welding (near welder)
3. (TRAUMA) Is the **eyeball cut open** or is fluid **leaking** out of it?

## POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. (TRAUMA) **Do not touch**, irrigate, or bandage the eye.
- c. (Chemical) Gently **flush** with lots of water. **Continue** flushing until help arrives.
- d. (Penetrating object) **Do not pull it out**.
- e. (SEVERE eye injuries) Keep the head **above** chest-level.

Instructions for Taking a Pulse	Rules	
<p>(Read verbatim)</p> <p>Find the Adam's apple on her/his neck. Feel on either side of it for a pulse. Be careful not to push too hard. Count the pulses for 15 seconds. (I'll time you.)</p> <p>How many did you count?</p> <ul style="list-style-type: none"> <li>• <math>\leq 12</math> = <math>&lt; 50</math> bpm</li> <li>• <math>\geq 33</math> = <math>\geq 130</math> bpm</li> </ul>	<ol style="list-style-type: none"> <li>1. <b>INEFFECTIVE BREATHING</b> discovered during Key Questioning should be coded as <b>SEVERE RESPIRATORY DISTRESS</b> (DELTA).</li> <li>2. The caller should be directed to <b>take a pulse whenever it is physically possible</b> (age, location, comprehension).</li> <li>3. If the patient has a <b>slow or very rapid</b> heart rate (<math>&lt; 50</math> bpm or <math>\geq 130</math> bpm), <b>paramedics</b> (ALS) <b>should be sent</b>.</li> <li>4. <b>A.I.C.D.s</b> are becoming more common. A single firing may be normal; however, <b>multiple firings</b> or firings associated with <b>priority symptoms</b> may indicate a <b>prehospital emergency</b>. ALS evaluation for these patients is recommended.</li> <li>5. If the <b>caller asks</b> whether the patient should be given their medication now, the EMD should <b>only give instructions included in the protocol</b>.</li> </ol>	<ol style="list-style-type: none"> <li>2. Complaints such as cancer, leukemia, chronic illness, stroke, dehydration, infection, meningitis, etc. may incorrectly elicit an emotional response from EMDs since these diagnosis-based terms sound serious. <b>The caller's "diagnosis" may have nothing to do with the actual reason the patient needs help now.</b></li> <li>3. Automated external defibrillators (AED) might also be called <b>"shock boxes."</b> Other local names may be used.</li> </ol>
<p><b>SEVERE RESPIRATORY DISTRESS</b></p> <p>Complaints may include but are not limited to:</p> <ul style="list-style-type: none"> <li>• Changing color</li> <li>• Difficulty speaking between breaths (unable to complete a full sentence without breathing; can only speak a few words at a time)</li> </ul>	<p><b>Axioms</b></p> <ol style="list-style-type: none"> <li>1. <b>Heart Problems are considered a specific "diagnosis."</b> Heart problem situations range from old rheumatic fever, through benign forms of congestive heart failure, to acute angina or serious heart attack (myocardial infarction). "Heart Problems" are occasionally reported as the Chief Complaint in cardiac arrest.</li> </ol>	<p><b>Heart Attack Symptoms</b></p> <p>EMDs may initially receive non-specific complaints in heart attack cases. Due to patient denial or caller confusion, the following <b>symptoms may not be recognized as a heart attack:</b></p> <ul style="list-style-type: none"> <li>• Aching pain</li> <li>• Chest pain (now gone)</li> <li>• Constricting band</li> <li>• Crushing discomfort</li> <li>• Heaviness</li> <li>• Numbness</li> <li>• Pressure</li> <li>• Tightness</li> </ul> <p>While these symptoms are most common in the <b>chest</b>, they may also (or only) be present in the <b>arm(s), jaw, neck, or upper back</b>. These symptoms should be <b>handled on Protocol 10</b>.</p>
<p><b>A.I.C.D.</b></p> <p>An <b>Automatic Implanted</b> (internal) <b>Cardiac Defibrillator</b> is a device designed to administer an electric shock to <b>control tachyarrhythmias</b> (rapid heart rate) and restore a normal heartbeat.</p>		

## 20 HEAT / COLD EXPOSURE

### KEY QUESTIONS

1. (≥ 35) Does s/he have **chest pain**?  
Yes \_\_\_\_\_ 10
2. Is s/he **completely awake** (alert)?
3. Does s/he have a **history of heart problems**?
4. Does s/he have a **change in skin color**?
5. What is her/his **skin temperature**?  
Colder than normal  
Hotter than normal  
Normal  
Unknown

### POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. (**Heat exposure**) **Remove her/him from any sources of heat.** **Remove her/his outer clothing.** Apply **cool water** to her/his entire **skin** surface while **fanning** her/him. **Turn on an air conditioner** or fan.
- c. (**Cold exposure**) **Protect her/him from the cold.** **Remove wet clothing.** **Warm her/him without rubbing** the affected area. **Do not give her/him any alcohol** to drink.

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

ENTRAPMENT	Confined Space	4. The caller should be advised <b>not to enter or re-enter a hazardous or dangerous environment</b> .
A situation involving <b>prevention of escape</b> in which there is an increased threat of injury, illness, or death to a victim.	Any <b>enclosed space</b> in the workplace that has three specific features (per OSHA):	5. Scene safety should include advising the caller <b>not to touch any equipment that may be suspending the victim</b> .
<b>PERIPHERAL</b>	<ul style="list-style-type: none"> <li>Must have the <b>size</b> and <b>shape</b> to allow a person to <b>bodily enter</b>.</li> <li>Must have <b>restricted openings</b> that make it <b>difficult</b> to enter or leave.</li> <li>Must be a space <b>not designed for continuous human occupancy</b>.</li> </ul>	
<ul style="list-style-type: none"> <li>Finger</li> <li>Foot</li> <li>Forearm</li> <li>Hand</li> <li>Leg, lower</li> <li>Toe</li> <li>Wrist</li> </ul>	<b>Mudslide</b>	
<b>→ Determinant Suffixes</b>	A moving "river" of <b>rock, soil, and water</b> , often triggered by storms, volcanic activity, earthquakes, fires, or mismanagement of land.	
The suffix codes help to delineate the type of problem for specific response and safety purposes:	<b>Avalanche</b>	
<b>A</b> = Above ground (≥ 6ft/2m)	A mass of <b>snow sliding down</b> a mountainside.	
<b>M</b> = Multiple victims	<b>Rules</b>	
<b>B</b> = Both Above ground & Multiple victims	1. An appropriate <b>extrication team</b> should be sent for all <b>mechanical/machinery ENTRAPMENT</b> situations.	
<b>MEDICAL</b>	2. <b>All structures are considered occupied</b> until proven otherwise.	
An <b>illness</b> or other <b>biological malady</b> .	3. A call involving an <b>ENTRAPMENT</b> should be considered an <b>extrication situation</b> until responding units arrive and assess the circumstances.	
<b>TRAUMA</b>		
A <b>physical injury</b> or <b>wound</b> caused by an external force through accident or violence.		
<b>Structure Collapse</b>		
Structural collapse may occur as a result of <b>fire, weather conditions, earthquake</b> , or simply because an <b>old</b> or otherwise <b>weak structural component fails</b> .		
		<b>Axioms</b>
		1. The <b>number of people</b> involved (or hurt) should be determined during Case Entry whenever possible.
		2. Even though these calls may be 3 <sup>rd</sup> party, it is important to <b>determine if the patient requires extrication</b> .
		3. It is very helpful for the <b>responders to know if the case is TRAUMA or MEDICAL</b> since different equipment must often be carried long distances to the site.
		4. Most confined space injuries and deaths result from <b>asphyxiation</b> due to hazardous atmospheres.
		5. <b>Emergency service personnel must often utilize special tools and techniques</b> when called upon to rescue someone trapped in any type of machinery or materials.
		<b>Third Law of Responders</b>
		If there is more than one unconscious patient on-scene, there may be scene safety implications.

KEY QUESTIONS

1. (Appropriate) Was this **accidental** or **intentional**?

☛ Unconscious (per Case Entry) \_\_\_\_\_ ☛ 23-D-1

2. (Suspected and ≥ 8) Is s/he **violent**? ☛

3. Is s/he **completely awake** (alert)?

4. Is s/he **breathing normally**?

5. **What did s/he take?** ☛

- Acid or Alkali (lye)
- Antidepressants (tricyclic)
- Cocaine (or derivative)
- Narcotics (heroin)

6. **When** did s/he take it?

POST-DISPATCH INSTRUCTIONS

a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.

- \* (Appropriate) Connect and **confirm** transfer of the caller to **poison control center.** ☛
- \* **Stay on the line with caller** if her/his condition seems **unstable** or is **worsening.**
- \* In volatile/criminal situations, refer to applicable law **enforcement protocol.** ☛

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

**SEVERE RESPIRATORY DISTRESS**

Complaints may include but are not limited to:

- Changing color
- Difficulty speaking between breaths (unable to complete a full sentence without breathing; can only speak a few words at a time)

**OVERDOSE**

**Intentional** intake of a potentially harmful substance.

**POISONING (Ingestion)**

**Accidental** intake of a potentially harmful substance.

☛ **Problem Suffixes**

The suffix codes help to delineate the type of problem for specific response and safety purposes:

- A = Accidental
- I = Intentional
- P = Poison Control request for response

**Rules**

1. **INEFFECTIVE BREATHING** discovered during Key Questioning should be coded as **SEVERE RESPIRATORY DISTRESS (DELTA)**.

2. When approved and arranged by the local Medical Control, most asymptomatic ingestions (not including antidepressants, cocaine, narcotics, acids, or alkalis) should be referred to the regional Poison Control Center. If Poison Control's evaluation indicates the necessity of a mobile response, **they will inform medical dispatch.**
3. If an OMEGA (Ω) referral to a Poison Control Center is not locally approved, the appropriate response is locally determined. **"Home care,"** which has been used by regional Poison Control Centers with great success, is an OMEGA (not an ALPHA) code because an EMS response may not be necessary.
4. Consider call tracing if there are problems with location, identification, or information cooperation. **Carefully and tactfully determine the patient's exact location.**
5. The airway of an unconscious patient **must be constantly maintained.**

**Axioms**

1. Because **OVERDOSE** patients have a motive for their actions, they are **frequently misleading about the time, amount, or type of medication taken.**
2. **OVERDOSE** is an intentional act. Even if the amount or type of substance is not

dangerous, these patients **need social or psychological intervention** and occasionally protection from themselves.

3. **Tricyclic antidepressants can cause collapse and unconsciousness very quickly,** even though initially the patient may appear all right. Updated name lists of currently marketed brands can be kept at dispatch for reference.
4. The ability of **cocaine** to induce strokes and heart attacks is of serious concern. Cocaine has several **derivatives** and **street names** such as "crack" and "blow."
5. **Narcotics (heroin, morphine, Demerol™) can cause a rapid loss of consciousness and respiratory arrest.** Supporting the patient's breathing is essential. The effects of narcotic **OVERDOSE** can be treated with a specific drug (**naloxone**) in the prehospital environment.
6. **Cardiac medications can cause collapse and unconsciousness very quickly,** even though the patient may initially appear to be all right. Medications prescribed for high blood pressure, arrhythmias, and congestive heart failure are the most dangerous. They are common in many households

KEY QUESTIONS

(\*1st Party Only)

1. How many **weeks** (or **months**) pregnant is she?
2. (**≥ 5 months/20 weeks**) Is the baby **completely out**?  
 Yes \_\_\_\_\_ \* 24-D-6  
 a. (No) Can you **see** (\*feel or touch) any part of the **baby** now?  
 (You go check and tell me what you find.)  
**BREECH** or **CORD** \_\_\_\_\_ \* 24-D-1  
**Head visible/out** \_\_\_\_\_ \* 24-D-2
3. (**≥ 5 months/20 weeks**) Is she having **contractions**  
 (labor pains)?  
 a. (Yes) Is this her **first** delivery?  
 b. (Yes) How many **minutes apart** are the contractions  
 (labor pains)?
4. Is there any **SERIOUS bleeding**?
5. Does she have any **HIGH RISK** complications?

POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. **Do not** try to **prevent** the birth (**do not** cross legs).
- c. **Do not** sit on the **toilet**.
- d. Allow her to assume the **most comfortable** position and have her take **deep breaths between contractions** (labor pains).
- e. (**OMEGA referral**) Tell her to **call her healthcare provider** or go **directly to the hospital** to be evaluated.

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,807,481

AMPDS® v11.2, NAE-std, 041214

**DANGEROUS Hemorrhage**

- Armpit
- Groin
- Neck

**SERIOUS Hemorrhage**

**Uncontrolled bleeding** (spurting or pouring) from any area, or any time a caller reports "serious" bleeding.

**MINOR Hemorrhage**

**Controlled or insignificant external bleeding** from any area.

**THREATENING SUICIDE**

Persons who are threatening to commit suicide **but have not yet done anything to harm themselves**. If a person has already harmed her/himself but is refusing help or entry, the suffix code for **Violent (V)** should be added to the Determinant Code and police should be notified.

➔ **Problem Suffixes**

The suffix codes are added whenever the patient appears to be violent or have weapons, and aid in automatically notifying police to respond and secure the scene:

- V = Violent
- W = Weapons
- B = Both Violent and Weapons

**Rules**

1. If the actual type of suicide attempt is determined to be overdose, carbon monoxide, stab, or gunshot wound, go to and **dispatch from that more specific protocol**.
2. 1<sup>st</sup> party callers who are **THREATENING SUICIDE** should be **kept on the line until responders arrive**.
3. Consider call tracing if there are problems with location, identification, or information cooperation. **Carefully and tactfully determine the patient's exact location**.
4. **Constricting or suffocating materials**, such as rope, wire, or plastic bags, should be **removed prior to the provision of PDIs**. Care should be exercised to preserve potential crime scene evidence (i.e., the noose should be cut or loosened rather than untied).

**Axioms**

1. Behavioral emergency patients (at any level of consciousness) are considered to be a **potential risk to themselves and others**.
2. Certain serious medical problems can be confused as "just a psych problem." It would be a **serious EMD error to not respond at all**. These problems include

- insulin shock, severe blood loss, lack of oxygen, delirium tremens (the DTs), overdose, liver or kidney failure, etc.
3. Certain stages of insulin shock can easily be **confused with alcohol intoxication or psychiatric problems**.
  4. **Delirium tremens** (the DTs) is a severe metabolic derangement that has a surprisingly high in-hospital mortality rate and **should not be underestimated**.
  5. **It is reasonable to utilize a police-only response** when a person is **THREATENING SUICIDE** (no injuries have occurred). This choice must be **approved by local policy** between the law enforcement and EMS-provider agencies.

**Causes of Abnormal Behavior**

- Alcohol intoxication
- Drug abuse
- Emotional and hysterical reactions
- Hypovolemic shock (low blood volume)
- Medical problems and serious illnesses
- Psychiatric problems
- Suicide attempts and threats
- Withdrawals

**26 SICK PERSON (SPECIFIC DIAGNOSIS)**

KEY QUESTIONS

1. Is s/he **breathing normally**?  
No \_\_\_\_\_ **6**
2. (**Female ≥ 45, male ≥ 35**) Does s/he have **chest pain**?  
Yes \_\_\_\_\_ **10**
3. Is s/he **bleeding** or **vomiting blood**?  
Yes \_\_\_\_\_ **21**
4. Is s/he **completely awake** (alert)?
5. Does s/he have a **history of heart problems**?

POST-DISPATCH INSTRUCTIONS

a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

**NON-PRIORITY Complaints (ALPHA-level)**

2. Boils
3. Bumps (non-traumatic)
4. Can't sleep
5. Can't urinate (without abdominal pain)
6. Catheter (in/out without hemorrhaging)
7. Constipation
8. Cramps/spasms/joint pain (in extremities and non-traumatic)
9. Cut-off ring request
10. Deafness
11. Defecation/diarrhea
12. Earache
13. Enema
14. Gout
15. Hemorrhoids/piles
16. Hepatitis
17. Hiccups
18. Hungry
19. Nervous
20. Object stuck (nose, ear, vagina, rectum, penis)
21. Object swallowed (without choking or difficulty breathing, can talk)
22. Penis problems/pain
23. Rash/skin disorder (without difficulty breathing or swallowing)
24. Sexually transmitted disease (STD)
25. Sore throat (without difficulty breathing or swallowing)
26. Toothache (without jaw pain)
27. Transportation only
28. Wound infected (focal or surface)

**Sick Person**

A patient with a non-categorizable Chief Complaint who does **not have an identifiable priority symptom**.

**Priority Symptoms**

- The presence of:
- **Abnormal breathing**
  - **Chest pain** (any)
  - **Decreased level of consciousness**
  - **SERIOUS hemorrhage**

**Rules**

1. Find and **use the correct Chief Complaint** and **go to it** via the **SHUNT** pathway.
2. This Chief Complaint should be used for patients with an "unknown problem" **who are with or near the caller** (2<sup>nd</sup> party).

**Axioms**

1. When the caller gives dispatch a previous disease or a current diagnosis, it may be because the **caller does not know what is actually causing the patient's immediate problem**.
2. A complete interrogation obtains symptoms that can be **correctly prioritized**.
3. Complaints such as cancer, leukemia, chronic illness, stroke, dehydration, infection, meningitis, etc. may incorrectly elicit an emotional response from EMDs since these diagnosis-based terms sound serious. **The caller's "diagnosis" may have nothing to do with the actual reason the patient needs help now.**

KEY QUESTIONS

- (OBVIOUS DEATH – Explosive GSW to head)** Do you think s/he is **beyond any help** (resuscitation/CPR)?  
 Yes \_\_\_\_\_ Z-B-5  
 \* Unconscious or Arrest (per Case Entry) \_\_\_\_\_ Z-D-1
- Is the **assailant** (attacker) **still nearby**?
- Is there any **SERIOUS bleeding**?  
 \* Unconscious, Arrest, **OBVIOUS DEATH** (per Case Entry) \_\_\_\_\_
- Is s/he **completely awake** (alert)?
- What **part** of the body was **injured**?
- Is there **more than one wound**?
- When** did this happen?

POST-DISPATCH INSTRUCTIONS

- I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- (Penetrating object)** **Do not** pull it out.

\* In volatile/criminal situations, refer to applicable law enforcement protocol.

AMPDS® v11.2, NAE-std, 041214

➕ Problem Suffixes	STROKE	Axioms
<p>The suffix codes for <b>STROKE</b> designate a locally defined time frame regarding the treatment window for <b>STROKE</b> victims. The <b>Less than (L)</b>, <b>Greater than (G)</b>, and <b>Unknown (U)</b> suffix codes are added to the Determinant Code based on the caller's answer to the "When was s/he last without this problem?" Key Question. Hospital and/or responder notification regarding these codes should be further defined by local policy and procedure.</p> <p><b>Local Medical Control must set and authorize</b> the time treatment window below before these Determinant Suffixes can be used:</p> <p><b>L</b> = Less than "X" hours since the patient was last without problem</p> <p><b>G</b> = Greater than "X" hours since the patient was last without problem</p> <p><b>U</b> = Unknown when the patient was last without problem</p> <p>* Note: "X" = time window set by local Medical Control:</p> <div style="border: 1px solid black; width: 100px; height: 20px; margin: 5px 0;"></div>	<p><b>Disruption of blood flow to the brain</b> or part of the brain due to a blood clot or hemorrhage. Hemorrhage also causes increased pressure within the skull. Clots can be spontaneous or traumatic. Paralysis or weakness of one side, trouble speaking, altered level of consciousness, respiratory changes, vision problems, and sudden onset of severe headache are all common symptoms.</p> <p><b>Thrombolytic Therapy</b></p> <p>The use of drugs such as tissue Plasminogen Activator (t-PA) and Streptokinase to break down the blood clots that may precipitate a <b>STROKE</b>. This therapy has resulted in new hope for people who suffer <b>STROKE</b>. EMD is a vital first link in the chain of recovery for these patients.</p> <p><b>Rules</b></p> <ol style="list-style-type: none"> <li>1. In order to correctly identify potential <b>STROKE</b> patients and to correctly identify priority symptoms, <b>always follow the Key Question interrogation sequence</b>.</li> <li>2. Some <b>STROKES</b> can now be effectively treated, but the time for successful therapy is quite short. Lights-and-siren are not recommended; however, there should be a sense of urgency. <b>STROKE must receive an immediate response that is not subject to delay.</b></li> </ol>	<ol style="list-style-type: none"> <li>1. <b>Cerebrovascular Accident (CVA)</b> and "brain attack" are commonly used terms for <b>STROKE</b>.</li> <li>2. Just because the caller says the problem is a "stroke" <b>does not necessarily mean</b> that this diagnosis is correct.</li> <li>3. Alert <b>STROKE</b> patients should be treated as if they can hear and are aware of their surroundings. If the patient is conscious but not talking, <b>verbal reassurance may be helpful</b>.</li> <li>4. The likelihood of a <b>patient who has a history of STROKE</b> having another <b>STROKE</b> is greater than the likelihood of a member of the general population having a first <b>STROKE</b>.</li> <li>5. Some <b>younger people have STROKES</b> (often fatal) from a ballooned blood vessel called a <b>berry aneurysm</b> that expands and then breaks. This condition is present from birth (congenital). Early symptoms include sudden, severe headache.</li> </ol>

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

**MAJOR INCIDENT (D-1)**

Any evidence to suggest serious injuries to multiple patients or a need for increased resources due to the size of the event. Incidents may include:

- a - Aircraft
- b - Bus
- c - Subway/Metro
- d - Train
- e - Watercraft

**HIGH MECHANISM (D-2)**

Any evidence to suggest serious injuries to any patient as a result of the mechanism of injury. Incidents may include:

- a - All-terrain
- b - Auto-bicycle/motorcycle
- c - Auto-pedestrian
- d - Ejection
- e - Personal watercraft
- f - Rollovers
- g - Vehicle off bridge/height

**HAZMAT**

An incident involving a gas, liquid, or material that, in any quantity, **poses a threat to life, health, or property.**

**SERIOUS Hemorrhage**

**Uncontrolled bleeding** (spurting or pouring) from **any area**, or any time a caller reports **"serious" bleeding.**

**NOT DANGEROUS Body Area**

- Ankle
- Arm
- Collar bone (clavicle)
- Elbow
- Finger
- Foot
- Hand
- Hip
- Knee
- Leg, lower (tibia)
- Shoulder
- Toe
- Wrist

**Rules**

1. The **head-tilt is the preferred method of airway control** in the dispatch environment. When a neck injury is likely, an attempt should first be made to open the airway without moving the neck. If this is unsuccessful, then advise to **gently tilt the head back**, a little at a time, until air goes in and the chest rises.
2. The patient's **age does not formally need to be determined initially in traffic accidents** (and other multiple patient events). If individual patient assessment is possible, age should be determined at that time.

**Axioms**

1. The **nature of the accident** (such as a rollover) and **number of injured patients** should be determined during Case Entry.
2. A caller who is in close proximity to a non-hazardous scene should be asked to return to the patient(s) to **check ABCs** and for **SERIOUS hemorrhage.**
3. In **single-vehicle** accidents (car vs. pole, car off the road), **consider medical problems** such as fainting, heart attack, diabetes, etc. as a **possible cause.**
4. A traffic accident in which injury to a **NOT DANGEROUS** Body Area is **reported but not verified by a 1st party caller** should be classified as Injuries (29-B-1) because of the mechanism of injury.
5. Medical Dispatch should always try to **obtain complete information.** Even if law enforcement personnel initially request "paramedics," response should be driven by specific priority problems (see SEND Protocol).

**SEND Protocol (Medical Miranda Card)**

**Secondary Emergency Notification of Dispatch (SEND)** from police should include Chief Complaint, approximate age, level of consciousness, breathing status, presence of chest pain, and severity of bleeding (and opinion of need for lights-and-siren response).

KEY QUESTIONS

1. Is s/he **completely awake** (alert)?
2. Is s/he **breathing normally**?
3. What **part** of the body was **injured**?
4. Is there any **SERIOUS** bleeding?
5. (**Amputation**) Have the **parts** been **found**?
6. **When** did this **happen**?

POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. **Do not move** her/him unless s/he is in **danger**.
- c. **Do not splint** any injuries.

DLS \* Link to X-1 unless:

AMPDS® v11.2, NAE-std, 041214

Protected by U.S. Patents 5,857,966; 5,989,187; 6,004,266; 6,010,451; 6,053,864; 6,076,065; 6,078,894; 6,106,459; 6,607,481

AMPDS® v11.2, NAE-std, 041214

**SEVERE RESPIRATORY DISTRESS**

Complaints may include but are not limited to:

- Changing color
- Difficulty speaking between breaths (unable to complete a full sentence without breathing; can only speak a few words at a time)

**? Determining AGONAL BREATHING**

When the patient is **unconscious** or **not alert** and is **breathing abnormally** or **irregularly**, the EMD should **tell the caller** to state when the patient **takes each breath**. If the **time between breaths is 10 seconds or more**, this should be immediately considered **INEFFECTIVE BREATHING** that is likely a fading, **AGONAL** (dying) respiratory pattern. Check a maximum of **five breaths** (four intervals tested).

**(Read verbatim) Okay, I want you to tell me every time s/he takes a breath, starting now.**

- **AGONAL = ≥ 10 sec. interval**

**Rules**

1. **INEFFECTIVE BREATHING** discovered during Key Questioning should be coded as **SEVERE RESPIRATORY DISTRESS (DELTA)**.
2. An unconscious person in whom breathing cannot be verified by a 2<sup>nd</sup> party caller (with the patient) is considered to be in **cardiac arrest until proven otherwise**.

3. **Stay on the line with the caller when the patient is still unconscious** to ensure ABCs until responders arrive.
4. The initial Chief Complaint of **seizure**, even if the patient is unconscious and not breathing (or if breathing status is uncertain), should be **handled on Protocol 12**.
5. The airway of an unconscious patient **must be constantly maintained**.

**Axioms**

1. Fainting implies a state of unconsciousness from which the patient has "come to." While this is generally less serious than prolonged unconsciousness, it **does not imply a benign condition and should be medically evaluated**.
2. The Chief Complaint and the main associated symptoms (such as fainting) are sometimes reversed by the caller in **ectopic pregnancy and aneurysm cases**.
3. If the **caller doesn't seem to understand "Is s/he completely awake,"** ask "alert," "able to talk normally," "with it," "making sense," or a more descriptive phrase to determine any decrease in level of consciousness.
4. "Funny noises" reported by the caller generally means the patient is unconscious with an uncontrolled airway and often represents **AGONAL** (dying) respirations at the **beginning of a cardiac arrest**.

5. **AGONAL respirations can be confused with "still breathing"** before they fade away during an arrest.

**First Law of Fainting**

Near fainting is best described as "almost fainted" and should be considered the same as fainting (not just dizzy).

**Third Law of Responders**

If there is more than one unconscious patient on-scene, there may be scene safety implications.

**EMD's First Law of Scene Helpers**

Always assume there is a pillow or other object behind the patient's head unless you know otherwise.

**Causes of Sudden Unconsciousness**

- Cardiac arrest
- Diabetic problems
- Fainting (syncope)
- Head injury
- Heart attack
- Hypovolemic shock (low blood volume)
- Intoxication
- Irregular heart rhythm
- Overdose, poisoning, drugs
- Respiratory insufficiency
- Seizures
- **STROKE (CVA)**

## 32 UNKNOWN PROBLEM (MAN DOWN)

### KEY QUESTIONS

1. Does s/he appear to be **completely awake** (alert)?
2. Did you ever hear her/him **talk** (cry)?
3. What is s/he **doing**—standing, sitting, or lying down?
  - a. (**Sitting or lying**) Is s/he **moving at all**?
4. Where **exactly** is s/he?

### POST-DISPATCH INSTRUCTIONS

- a. I'm sending the **paramedics** (ambulance) to help you now. **Stay on the line** and I'll tell you **exactly** what to do next.
- b. If it's **safe** to do so, see if s/he is **conscious** and **breathing**, or **moving at all**, then **return to the phone** and tell me. ▾

\* Advise the caller to look for and **direct the emergency unit** to the patient.

AMPDS® v11.2, NAE-std, 041214

LIFE STATUS QUESTIONABLE	Rules	Location and Problem Relationship
<p><b>Existence of any information suggesting:</b></p> <ul style="list-style-type: none"> <li>• Abnormal breathing</li> <li>• Cardiac arrest</li> <li>• Major injury</li> <li>• Unconsciousness</li> <li>• Uncontrollable bleeding</li> </ul>	<ol style="list-style-type: none"> <li>1. <b>Relay the type of location</b> (if known) to responding units, not just the address.</li> <li>2. If the actual type of problem (Chief Complaint) becomes apparent during interrogation, go to and <b>dispatch from that more specific protocol</b>.</li> <li>3. If <b>LIFE STATUS</b> is <b>QUESTIONABLE</b> at the end of all interrogation, a <b>maximal response should be sent</b> (DELTA-level).</li> </ol>	<p>Location can suggest the type of problem. These are examples used only to illustrate the concept underlying Rule 1:</p> <ul style="list-style-type: none"> <li>• <b>Bank</b> = cardiac arrest</li> <li>• <b>Garage</b> = carbon monoxide, electrocution</li> <li>• <b>Park</b> = assault, choking</li> <li>• <b>Restaurant</b> = choking, severe allergic reaction</li> <li>• <b>Street</b> = auto-pedestrian, cardiac arrest, seizure</li> </ul>
<p><b>Frenza's Law</b>                      A thing not looked for is seldom found.</p>	<p><b>Axioms</b></p> <ol style="list-style-type: none"> <li>1. Often, unknown problem calls are 3<sup>rd</sup> party. Obtaining specific symptoms may be difficult; however, a <b>problem isn't "unknown" until all required questioning has been completed</b>.</li> <li>2. Even though callers may be some distance from the patient, they <b>might have seen the patient moving</b>, heard them talking, or observed or been told the patient's position (standing, sitting, lying).</li> <li>3. <b>Standing patients are less likely to be in cardiac arrest than sitting patients</b>, who are, in turn, less likely to be in cardiac arrest than patients lying motionless.</li> </ol>	<p><b>First Law of Medical Dispatch</b>                      First, do no harm.</p> <p><b>Second Law of Medical Dispatch</b>                      When in doubt, send them out.                      (Always err in the direction of patient safety.)</p> <p><b>Third Law of Medical Dispatch</b>                      Don't be in doubt so much.                      (With proper training, protocol, and time to do the job right, guesswork will be minimized.)</p> <p><b>Fourth Law of Medical Dispatch</b>                      The science of medical dispatch requires non-discretionary compliance to protocol.</p>

**KEY QUESTIONS**

1. Is this call a **result** of an **evaluation** by a **nurse** or **doctor**?  
 No \_\_\_\_\_ 1-32
2. Is s/he **completely awake** (alert)?  
 a. (No) Is this a **sudden** or **unexpected change** in her/his **usual condition**?
3. Is s/he **breathing normally**?  
 a. (No) Is this a **sudden** or **unexpected change** in her/his **usual condition**?
